

MoSPI Training Module: Fundamentals of Statistical Data Collection

1. Sampling Techniques and Frameworks

In large-scale national surveys managed by MoSPI, Simple Random Sampling (SRS) ensures every unit in the population has an equal non-zero probability of selection. Stratified Random Sampling is preferred when target populations exhibit heterogeneous sub-groups (e.g., rural vs. urban) to improve national estimation precision.

2. Primary Data Validation & Range Checks

Primary data collected by field officers must undergo double-entry verification and automated range checks to prevent outliers caused by typographical mistakes. Missing value imputations follow international statistical protocols like hot-deck imputation.

3. Consumer Price Index (CPI) Benchmark

The Consumer Price Index (CPI) measures temporal changes in the general price level of goods and services consumed by households. The base year serves as a benchmark (standardized at an index value of 100).
